

## Exercise 4a

### Task Analysis and User Flows for a Food Delivery App

---

#### AIM:

To understand and document the steps a user takes to complete the main tasks within a food delivery app (e.g., Swiggy / Zomato).

Tool Link: <https://www.lucidchart.com/pages/>

#### PROCEDURE:

##### Step 1: Assigning Tasks

1. Browsing Restaurants
2. Searching for a Specific Food Item
3. Adding Items to the Cart
4. Placing an Order and Tracking

##### Step 2: Document User Flows

###### 1. Browsing Restaurants

5. Home Screen: User opens the app and lands on the home page with featured restaurants.
6. Restaurant Categories: User taps on a cuisine category (e.g., Indian, Chinese, Italian).
7. Restaurant List: User scrolls through the list of available restaurants.
8. Restaurant Menu: User taps on a specific restaurant to view its menu.

###### 2. Searching for a Specific Food Item

9. Search: User taps the search bar or icon.
10. Enter Query: User types the food item name or keyword.
11. Search Results: User reviews the list of matching items and restaurants.
12. Item Details: User taps on a specific item to view description, price, and restaurant.

###### 3. Adding Items to the Cart

13. View Menu: User browses or searches for a food item.
14. Item Details: User taps on the item to see description and customization options.
15. Add to Cart: User clicks "Add to Cart" and selects quantity/option.

### **3. Placing an Order and Tracking**

16. Open Cart: User taps on the cart icon.
17. Review Cart: User checks all items, quantities, and total price.
18. Proceed to Checkout: User clicks "Proceed to Pay".
19. Enter Delivery Address: User confirms or enters delivery location.
20. Select Payment Method: User chooses UPI, card, wallet, or COD.
21. Place Order: User clicks "Place Order".
22. Track Order: User views real-time delivery status on the map.

## **Step-by-Step Procedure to Create User Flows in Lucidchart**

### **23. Create a New Document**

- a. Go to Lucidchart and sign in or sign up if you do not have an account.
- b. Click on + Document or Create New Diagram.

### **24. Select a Template**

- a. You can start with a blank document or select a flowchart template.
- b. For this exercise, start with a blank document.

### **25. Add Shapes for Each Step**

- a. Drag and drop shapes from the left sidebar to represent different steps.
- b. Name each shape based on the steps from the task analysis:
  - c. Login / Register
  - d. Browsing Restaurants
  - e. Adding Items to Cart
  - f. Checkout and Payment
  - g. Order Tracking

### **26. Connect the Shapes**

- a. Use connectors to link the shapes, indicating the flow from one step to the next.
- b. Add arrows to show the direction of the flow.

### **27. Add Details to Each Step**

- a. Double-click on each shape to add text describing the action or decision.
- b. For example, for the "Login/Register" step: Open the app, Click "Login" or "Sign Up", Enter credentials, Verify OTP, Redirect to Home Screen.

### **28. Use Different Shapes for Different Actions**

- a. Use rectangles for general actions.
- b. Use diamonds for decision points (e.g., "Is the user logged in?").
- c. Use ovals for start and end points

### **29. Customize and Organize Your Flowchart**

- a. Arrange the shapes and connectors logically.
- b. Use different colors to distinguish between types of steps or user roles.
- c. Group related steps into sections for better clarity.

### **30. Review and Save Your Flowchart**

- a. Review the flowchart to ensure all steps are included and connected correctly.
- b. Save your flowchart by clicking on File -> Save.

### **31. Share and Collaborate**

- a. Click on the Share button to collaborate with others.
- b. You can also export your flowchart as an image or PDF for presentation purposes.

## **PART 1: FLOWCHARTS**

The flowcharts below document the complete user journey of the food delivery application, created using Lucidchart. Each process step is represented using standard flowchart notation — ovals for start/end, rectangles for process steps, and diamonds for decision points. The flow is divided into two parts for clarity: Part 1 covers app entry, authentication, browsing, and adding items to the cart; Part 2 covers checkout and order confirmation.

### **Flowchart – Part 1: Login, Browse and Add to Cart**

This flowchart begins at the Start node and traces the user's journey upon opening the application. A decision diamond checks whether the user is already logged in. If not, the user is directed to the Login/Register screen, where they enter and verify their credentials before reaching the Home Screen. Authenticated users proceed directly to the Home Screen.

From the Home Screen, the user can browse restaurant categories or search for specific food items. The user selects a restaurant, views the menu, and explores item details. Once a desired item is selected, the user adds it to the cart. The user may continue browsing and adding more items or proceed to open the cart for review.

### Flowchart – Part 2: Checkout and Order Confirmation

This flowchart continues from the Review Cart step and represents the checkout process through to order completion. After reviewing the cart, the user proceeds to checkout, where they enter their delivery address and select a preferred payment method such as UPI, card, or cash on delivery.

A decision point checks whether the payment is successful. If the payment fails, the user is prompted to retry the payment process. If successful, the order is placed, and the system confirms it by displaying an Order Confirmed screen. The user can then track the order in real time until delivery. The flow terminates at the End node.

### **Analysis of Flowcharts:**

- The decision diamond for “Is User Logged In?” ensures that unauthenticated users are redirected appropriately, maintaining secure access to the application.
- The separation between browsing actions and checkout actions improves clarity and reflects real user behavior.
- The checkout flow follows a logical sequence — Cart Review → Address Entry → Payment → Order Confirmation — ensuring that users complete all required steps.
- The retry mechanism in the payment step enhances usability by allowing users to correct failed transactions without restarting the process.
- Dividing the flowchart into two parts improves readability and avoids overcrowding in a single diagram.
- The End node after Order Confirmation clearly indicates successful completion of the user journey.

### **PART 2: WIREFRAME DIAGRAM**

A wireframe diagram presents the structural layout of the key screens in the food delivery application without applying visual styling or colour. It focuses on the arrangement of UI elements — navigation bars, search features, restaurant listings, cart details, and action buttons — to demonstrate how each screen functions and transitions to the next.

The wireframe below represents the core screens of the application: Home Screen, Restaurant/Menu Page, Cart, and Checkout, arranged sequentially to reflect the primary user flow defined in the flowcharts.

**Wireframe – Core Screens: Home → product page → Cart → Checkout**

### Screen-by-Screen Explanation:

The Home Screen acts as the entry point, showing categories, restaurants, and a search option for easy navigation. The Restaurant/Menu Screen displays food items, prices, and details, allowing users to select and add items. The Cart Screen summarizes selected items, quantities, and total cost for review. The Checkout Screen collects delivery address and payment details to process the order. The Order Confirmation Screen confirms successful order placement and provides tracking details.
