

USER INTERFACE AND DESIGN

Experiment – 3(b)

Design a Wireflow Diagram for a Food Delivery Mobile Application. Evaluate the user flow through Login, Restaurant Search, Cart, Checkout and Rating.

Wireflow Diagram

AIM:

The aim is to design a Wireflow Diagram for a Food Delivery Mobile Application that traces the complete user journey — from logging in, browsing and searching for restaurants and dishes, adding items to the cart, proceeding through checkout with payment, and finally submitting a rating — and to analyse how each screen and transition supports a clear, intuitive, and user-centred navigation experience.

PROCEDURE:

- Identify all key screens in the food delivery user journey: Splash Screen, Sign In, Sign Up, Home (Restaurant List), Search, Restaurant Details, Menu / Dish Details, Cart, Address & Delivery Options, Checkout, Payment Gateway, Order Confirmation, and Rate & Review.
- Sketch each screen as a wireframe using simple UI elements — input fields, buttons, images, icons, food cards, and navigation bars — without applying visual styling.
- Connect the wireframes with annotated arrows to show screen transitions, indicating the user action (e.g., tap, swipe, submit) that triggers each flow.
- Organise the wireflow into three logical phases: Login Process, Browse & Add to Cart, and Checkout & Rate.
- Review the complete diagram to ensure the flow is unbroken, logical, and covers both the primary path and key branch flows (e.g., Sign Up modal, Cart summary overlay).

OVERVIEW OF WIREFLOW DIAGRAM:

A Wireflow Diagram combines the structural detail of wireframes with the navigational clarity of a flowchart. Each screen is represented as a simplified wireframe showing its key UI components, while directional arrows between screens capture the interactions and transitions that drive the user forward. This makes wireflow diagrams particularly effective for mapping complex, multi-step user journeys such as those found in food delivery applications, where users must move through authentication, restaurant discovery, item selection, payment, and feedback stages in a coherent and intuitive sequence.

Group 1: Login Process

The login phase covers the entry point of the application. It includes the Splash Screen with the app logo, the Sign In screen, the Sign Up modal overlay for new users, and the Loading screen that bridges authentication and the main app. The wireflow shows a Sign In screen with email and password fields and a login button as the primary path. A branching arrow leads to a Sign Up modal for users who do not yet have an account. Once authenticated, an arrow leads to a Loading screen, which displays a spinner before the app transitions automatically to the Home screen.

Fig 1: Login Process — Sign In → Sign Up (modal) → Loading Progress → Home

The Splash Screen provides brand identity and sets the visual tone of the app. The Sign In screen uses a minimal layout to reduce friction for returning users. The Sign Up overlay pattern keeps new users contextually grounded — they remain aware they are in the authentication flow and can easily dismiss the modal to return to Sign In. The Loading screen serves as essential system feedback, preventing user confusion during data retrieval and signalling a smooth transition to the app's main experience.

Group 2: Search Product and Add to Cart

This phase covers the restaurant discovery and food selection journey. Starting from the Home screen, the user can browse featured restaurants or tap the search icon to navigate to the Search screen. Entering a query leads to Search Results showing a filtered list of restaurants. Selecting a restaurant opens the Restaurant Details screen — showing cuisine type, rating, and delivery time — from which the user taps to view the Menu. Tapping a dish card opens Dish Details with an image, description, and an "Add to Cart" button. Tapping Add to Cart triggers a Cart Summary overlay confirming the item, before the user proceeds to the full Cart screen with all selected items listed.

Fig 2: Search & Add to Cart — Home → Search → Results → Product List → Product Details → Cart → Cart Pop-Up

The Home screen acts as a discovery hub with a prominent search bar and restaurant cards, giving users multiple entry points. The Search screen is intentionally minimal — a single active search bar — to focus attention. Search Results display restaurant cards with ratings and delivery times for quick comparison. The Restaurant Details screen shows essential metadata before committing to the menu. The Dish Details screen's two action buttons (Add to Cart and Buy Now) cater to both deliberate and impulsive buyers. The Cart PopUp is a non-intrusive overlay confirming the action without interrupting the browsing flow, reducing cognitive friction and encouraging continued exploration.

Group 3: Checkout and Rate

The final phase takes the user from the cart to a completed order and closes the interaction loop with a rating prompt. From the Cart screen, a proceed button leads to the Address & Delivery screen for confirming the delivery location. Tapping Next navigates to the Checkout screen, which presents an order summary, delivery details, and a payment button. Tapping payment navigates to the Payment Gateway screen — represented as a modal with UPI/Card options and a confirm button. On successful payment, the wireflow transitions to the Order Confirmation screen, displaying a tick icon and an estimated delivery time. A "Rate Your Experience" button then leads to the Rate & Review screen, where the user sees a five-star widget, a text field for comments, and a submit button.

Fig 3: Checkout & Rate — Cart → Checkout → PayPal → Checkout Complete → Rate

The Address screen uses familiar location entry patterns to reduce delivery errors. The Checkout screen uses a checklist design to instil confidence before payment — users can visually verify their order, address, and total before committing. The Payment Gateway screen's multiple options (UPI, Card, Net Banking) cater to a broad Indian user base while building trust through familiar interfaces. The Order Confirmation screen uses a universally understood tick icon to provide immediate, unambiguous success feedback, reducing post-purchase anxiety. Placing the Rate screen immediately after delivery notification capitalises on the positive emotional state following a successful transaction, increasing the likelihood of users submitting genuine and favourable feedback.

ANALYSIS:

- The wireflow clearly maps a logical, unbroken user journey from Splash Screen to Rate & Review, covering all primary and secondary interaction paths.
- Modal overlays for Sign Up and Cart Popup are effective design choices — they provide necessary functionality without breaking the user's sense of context or flow.
- The three-phase structure (Login, Browse & Cart, Checkout) mirrors the natural mental model of a food delivery user, reducing cognitive load at each stage.
- Familiar navigation patterns — search bar, restaurant cards, cart icon, and labelled buttons — ensure the wireflow is accessible and learnable across all user groups including first-time users.
- The Payment Gateway screen with multiple options (UPI, Card, Net Banking) demonstrates how user-preferred payment methods can be embedded at the critical payment step to build trust.
- The Address screen placed before Checkout ensures delivery accuracy and reduces order errors, which is a critical touchpoint unique to food delivery compared to standard e-commerce.
- The Rating screen at the end of the flow closes the feedback loop, ensuring the application captures user sentiment at the point of highest satisfaction immediately after a successful delivery.
